Question No. 1

Two Cisco 5520 wireless LAN controllers are managing all access points throughout the network. The WLCs are in different locations to provide geographical redundancy. A mobility group has been configured on both WLCs and has a UP status on both controllers. The APs in location A are statically configured to use controller A as the primary and controller B as the secondary. If the WLC in location A goes offline, the APs successfully join the WLC in location B, but they do not fail over to their primary configured controller. Which configuration task fixes the issue?

- **A.** Configure the WLC in location A as primary using the CAPWAP AP Controller IP Address command on all the location A Access points.
- **B.** Use DHCP Option 43 and specify WLC in location A as primary.
- **C.** Enable AP fallback globally on the WLC
- **D.** Change the AP Failover Priority to critical.

- **B.** Create an SSID, place it to the desired VLAN under WLANs, and configure 802.1x in ISE to assign the correct VLAN based on the SSID from which the client is authenticating
- **C.** Create FlexConnect groups, place the access points in, and set the correct VLAN to SSID mapping based on location.
- **D.** Create mobility anchors for the SSID and on the controller under the internal SSID create a foreign map to the desired VLAN based on location.

Answer: A
